Comparable Company Analysis – Apple vs Peers

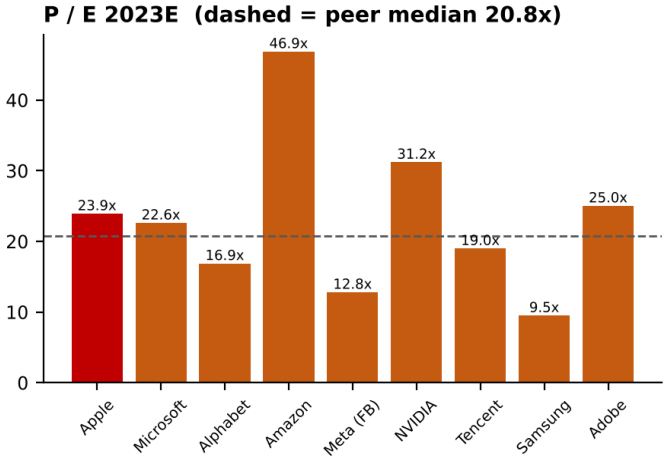

Trading multiples valuation · FactSet market data, 2022 · USD · MS Excel · Aditya Kushwaha

Apple Share Price	Peer Median EV/EBITDA 23E	Peer Median P/E 23E	Implied Price (avg of medians)	vs Share Price
$154.09	**14.0x**	**20.8x**	**$115.57**	**-25%**

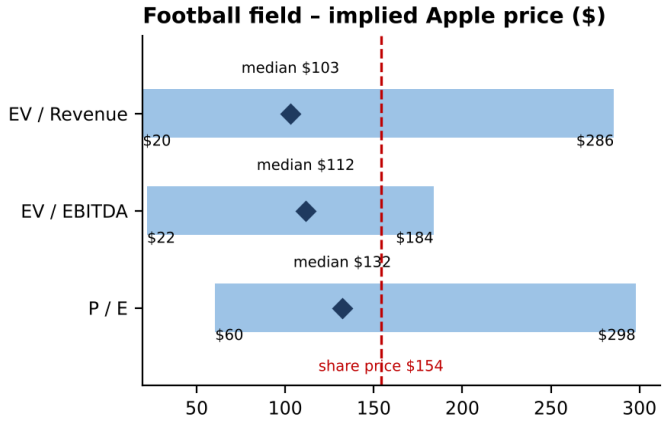

Key findings

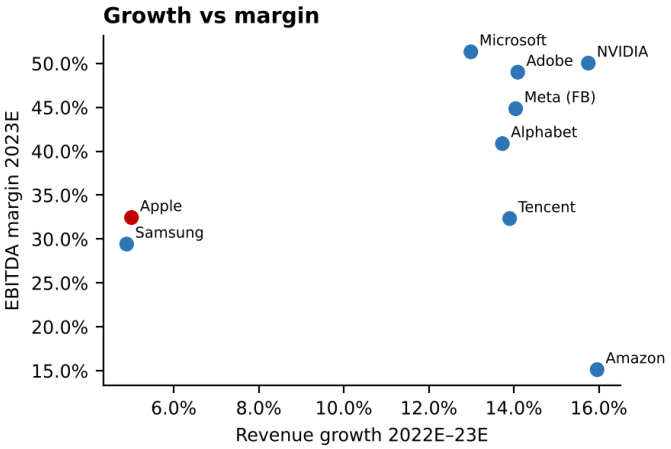

- At peer **median** 2023E multiples, Apple's implied share price is **$103–$132** (EV/Revenue $103, EV/EBITDA $112, P/E $132), against a market price of **$154.09**.
- Apple trades at a **premium of about 33%** to the average of those medians: 19.1x EV/EBITDA vs a 14.0x peer median.
- The premium is not explained by growth or margins: Apple's 2023E revenue growth is **5.0%** vs a 14.0% peer median, and its EBITDA margin **32.4%** vs 42.9%. It likely reflects factors simple multiples miss, such as scale, cash generation and buybacks.
- Ranges are wide because the peer set is mixed: Samsung trades at 3.2x EV/EBITDA and NVIDIA at 22.7x, so the median is the more reliable anchor than the mean.
- Amazon's 2022 P/E is shown as n/m (above 100x) because its 2022 net income was unusually low, and it is excluded from P/E statistics.

Apple shown in red. Medians exclude Apple.

Apple (highlighted) is the company being valued and is excluded from peer statistics. Median rows are highlighted in the valuation table below.

Implied valuation of Apple

Method	Statistic	Multiple	Implied EV ($bn)	Implied equity ($bn)	Implied price ($)	vs price
EV / Revenue	Minimum	0.9x	389	321	19.54	-87%
EV / Revenue	Median	4.2x	1,757	1,688	102.92	-33%
EV / Revenue	Mean	5.4x	2,263	2,195	133.81	-13%
EV / Revenue	Maximum	11.3x	4,753	4,685	285.60	+85%
EV / EBITDA	Minimum	3.2x	429	361	21.98	-86%
EV / EBITDA	Median	14.0x	1,899	1,830	111.58	-28%
EV / EBITDA	Mean	13.1x	1,784	1,715	104.58	-32%
EV / EBITDA	Maximum	22.7x	3,082	3,014	183.72	+19%
P / E	Minimum	9.5x	–	991	60.44	-61%
P / E	Median	20.8x	–	2,169	132.23	-14%
P / E	Mean	23.0x	–	2,397	146.11	-5%
P / E	Maximum	46.9x	–	4,885	297.80	+93%

Apple inputs: diluted shares 16,403m, cash $51.5bn, debt $120.0bn, 2023E EPS $6.35 (net income ÷ shares). EV-based price = (multiple × metric + cash – debt) ÷ shares; P/E-based price = multiple × EPS.

Corrections made to the original model

- EBITDA-based equity value added debt and subtracted the share count; it now adds cash and subtracts debt.
- Apple EPS was a typed 3.55; it is now 2023E net income ÷ diluted shares (6.35), which roughly doubles the P/E-based price.
- The date cell read July 2026 although the prices are 2022 market data; it is now labelled as the data period.
- Samsung is included in the multiples, since they need EV and market cap rather than the missing share count; P/E above 100x is treated as not meaningful.

Limitations

Multiples are a relative measure: they show how Apple is priced against these peers, not its intrinsic value. The peer set mixes software, internet, semiconductors and hardware, and the data is from 2022, so results describe that point in time. For learning purposes only, not investment advice.
